

KEY

Naming Ionic Compounds

What are the structural units that make up ionic compounds and how are they named?

Why?

When working in chemistry, it is often convenient to write a chemical in symbols. For example we might write down the substance table salt as NaCl. In talking about chemistry however, it is a bit tacky to say "en-ay see-ell" when we want to refer to a substance. Also, in formal writing we should use the name of the compound rather than its symbols. Therefore we need to learn how to say the proper names of ionic substances.

Model 1 – Ion Charges for Selected Elements

1	H ⁺										
2	Li ⁺	Be ²⁺						N ³⁻	O ²⁻	F ¹⁻	
3	Na ⁺	Mg ²⁺	Transition elements				Al ³⁺		P ³⁻	S ²⁻	Cl ¹⁻
4	K ⁺	Ca ²⁺	Fe ²⁺ Fe ³⁺	Ni ²⁺ Ni ³⁺	Cu ⁺ Cu ²⁺	Zn ²⁺					Br ¹⁻
5	Rb ⁺	Sr ²⁺			Ag ¹⁺			Sn ²⁺ Sn ⁴⁺			I ¹⁻
6		Ba ²⁺				Hg ₂ ²⁺ Hg ²⁺		Pb ²⁺ Pb ⁴⁺			

← Cations

 → Anions

1. Based on the information in Model 1:

a. Identify three elements that form only one cation.

b. Identify three elements that form only one anion.

c. Identify three elements that form more than one cation.

d. In what region of the periodic table are these "multiple ion" elements usually located?

Transition Metals

2. Consider the ions of potassium (K) and sulfur (S). Write chemical formulas for all possible ionic compounds involving these ions, using the simplest ratio(s) of potassium (K) and sulfur (S). Keep in mind that the sum of the charges in an ionic compound must equal zero.

3. Consider the ions of iron (Fe) and sulfur (S). Write chemical formulas for all possible ionic compounds involving these ions, using the simplest ratio(s) of iron (Fe) and sulfur (S). Keep in mind that the sum of the charges in an ionic compound must equal zero.

Model 2 – Ionic Compound Names (Metals that form one ion)

NaCl Sodium chloride	Zn_3P_2 Zinc phosphide
CaS Calcium sulfide	Al_2O_3 Aluminum oxide
Ag_2S Silver sulfide	SrCl_2 Strontium chloride

- Circle the symbol for the metal in each of the compounds in Model 2.
- Which element comes first in the name and formula of the compounds in Model 2—the metal or the nonmetal?

The metal

- Use the table of ions in Model 1 to answer the following questions:

a. In the compound zinc phosphide, what is the charge on the zinc ion?

+2

b. In the compound zinc phosphide, what is the charge on the phosphide ion?

-3

- Explain why a 3 to 2 ratio of ions is necessary for the compound zinc phosphide.

The sum of all ion charges for an ionic compound must equal zero

- The compound carbon dioxide has a name that gives you a hint as to how many oxygen atoms are in the compound. Is there anything in the name “zinc phosphide” that indicates there are three zinc and two phosphorus ions in the formula unit?

No

- Is there any other ratio of zinc and phosphorus ions that could exist? For instance, could you have Zn_2P or ZnP_2 ? Explain your answer.

No ~ You wouldn't get zero

- Explain why you don't need to specify the number of ions in the compound when you are naming ionic substances like those in Model 2.

If charges are known, the ratio can be determined w/o extra info

- Model 2 is labeled “Metals that form one ion.” What other metals that also form only one ion could be included in the Model 2 list? Model 1 may be helpful in this regard.

Answers will vary

- Describe how the names of the nonmetal elements in Model 2 are changed when they are in their anion forms.

The end of the name is changed to -ide

- Name the following ionic compounds using what you learned from Model 2.

Li_2O
Lithium
oxide

MgF_2
Magnesium
fluoride

Al_2S_3
Aluminum
sulfide

K_3N
Potassium
nitride

14. Provide the chemical formula for each of the following ionic compounds.

Barium chloride BaCl_2

Magnesium oxide MgO

15. Consider the two chemical formulas you wrote in Question 3 for compounds of iron and sulfur. Would the name "iron sulfide" be sufficient to uniquely identify either of those compounds? Explain.

No - could be FeS or Fe_2S_3

Read This!

When the metal in an ionic compound always forms an ion with the same charge, you need not indicate that charge as part of the compound name. However, some atoms have the ability to form more than one type of ion. This can make naming confusing. You can't simply refer to a compound of copper and oxygen as "copper oxide." People won't know which compound you are referring to— CuO or Cu_2O .

Model 3 – Ionic Compound Names (Metals that form multiple ions)

Cu_2O Copper(I) oxide

PbO Lead(II) oxide

CuO Copper(II) oxide

PbO_2 Lead(IV) oxide

SnF_2 Tin(II) fluoride

FeCl_2 Iron(II) chloride

SnF_4 Tin(IV) fluoride

FeCl_3 Iron(III) chloride

16. Model 3 is labeled "Metals that form multiple ions." What other metals that form multiple ions could be included in Model 3? Model 1 may be helpful in this regard.

Mercury + Nickel

17. Describe the most obvious difference between the names in Model 3 and those in Model 2.

The names have Roman Numerals in them

18. Do the Roman numerals in the names in Model 3 relate to the number of cations or number of anions in the formula unit? Support your answer by citing two specific examples.

Roman numerals do not necessarily match

PbO_2 = lead (IV) oxide, but 4 doesn't match Pb or O

CuO = copper (II) oxide, but 2 doesn't match Cu or O

19. Keeping in mind that the sum of the charges in an ionic compound must equal zero, use the chemical formulas in Model 3 to answer the following questions:

- a. Identify the charge on the copper cations in copper(I) oxide and copper(II) oxide, respectively.

Cu^+ Cu^{+2}

- b. Identify the charge on the iron cations in iron(II) chloride and iron(III) chloride, respectively.

Fe^{+2} Fe^{+3}

20. What do the Roman numerals in the compounds described in Question 19 indicate?

Roman numeral = the charge of the cation
in the compound

21. Fill in the table below using what you've learned from Model 3.

Compound	Charge on Cation	Name of the Compound
PbCl_4	Pb^{4+}	Lead(IV) chloride
Fe_2O_3	Fe^{+3}	Iron (III) oxide
SnO	Sn^{+2}	Tin (II) oxide
CuBr_2	Cu^{+2}	Copper (II) bromide

22. For each of the compounds in the table below, determine the type of metal in the compound and then name the compound using the correct naming method.

	Metal forms only one ion	Metal forms multiple ions	Name
CaBr_2	x		calcium bromide
MgO	x		magnesium oxide
Ag_3N	x		silver nitride
SnCl_2		x	tin (II) chloride
CuF_2		x	copper (II) fluoride
K_3P	x		potassium phosphide
Zn_3N_2	x		zinc nitride
HgO		x	mercury (II) oxide

Extension Questions

Model 4 – Traditional Names for Ionic Compounds

Metals that form one ion	Metals that form multiple ions
NaCl Sodium chloride	Cu ₂ O Cuprous oxide
CaS Calcium sulfide	CuO Cupric oxide
Ag ₂ S Silver sulfide	SnF ₂ Stannous fluoride
Zn ₃ P ₂ Zinc phosphide	SnF ₄ Stannic fluoride

23. Look at the traditional names in Model 4 for ionic compounds containing metals that form only one ion. What are the similarities and differences between the traditional naming system in Model 4 and the stock naming system in Model 2 for these kinds of ionic compounds?

The names are exactly the same

24. Look at the traditional names in Model 4 for ionic compounds containing metals that form multiple ions. What are the similarities and differences between the traditional naming system in Model 4 and the stock naming system in Model 3 for these kinds of ionic compounds?

The non metal (anion) endings are still "-ide" The metal names are different— ferric instead of iron(III), stannous instead of tin(II). There are no Roman numerals in the traditional name

25. Do the "-ous" and "-ic" endings in the compound names in Model 4 refer to a particular metal ion charge? Explain.

The endings do not appear to refer to specific ~~name~~ metals or ion charges.

The "-ic" ending is used for both Cu⁺² and Sn⁺⁴ in Model 4

26. Examine the traditional ion names shown below for selected metals. Write a rule for using the "-ous" and "-ic" endings for metal ions.

Cu ²⁺ cupric	Fe ³⁺ ferric	Sn ⁴⁺ stannic	Pb ⁴⁺ plumbic
Cu ¹⁺ cuprous	Fe ²⁺ ferrous	Sn ²⁺ stannous	Pb ²⁺ plumbous

The higher charged ion in a pair of possible ions for a given metal uses the "ic" ending. Use the Latin element name

27. Complete the table and write the traditional name for each ionic compound.

	Metal forms only one ion	Metal forms multiple ions	Name
CaBr ₂	X		Calcium bromide
MgO	X		Magnesium oxide
Ag ₃ N	X		Silver nitride
SnCl ₂		X	Stannous chloride
CuF ₂		X	Cupric fluoride
K ₃ P	X		Potassium phosphide
Zn ₃ N ₂	X		Zinc nitride
HgO		X	Mercuric oxide

28. Write the chemical formula for each ionic compound below.

aluminum bromide	AlBr_3
stannic sulfide	SnS_2
iron(II) chloride	FeCl_2
lithium oxide	Li_2O
plumbous oxide	PbO

29. Throughout this activity you have developed a process for naming an ionic compound when given a formula. On a separate sheet of paper, create a flowchart of questions that you might ask yourself when naming an ionic compound.
